# Imaging Services

**NORTH VALLEY HOSPITAL**

## COMPREHENSIVE IMAGING SERVICES

### Diagnostic Reading

NVH's radiology technologists produce high-quality images, which provides your physician with vital information to ensure accurate diagnosis. Our Radiologists are medical doctors, specializing in the interpretation of diagnostic imaging.

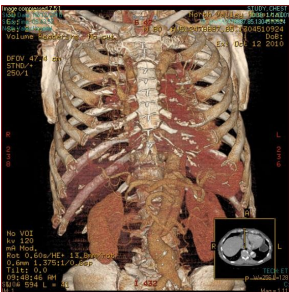

### Digital Mammography

Our staff provide warm and caring service to customers. We have highly trained female technologists, and our Radiologist has over 16 years of experience. We're the only facility in Okanogan County offering digital mammography. Less cancers go undetected with digital mammography. Not only will our radiologist be looking for suspicious areas on the image, so will a Computer Aided Detection (CAD) system. *Early detection is the best prevention!*

### CT Scan

At North Valley Hospital we use the latest 16-slice CT scanner. This means that we're able to provide a faster, higher-resolution scan which can then be reconstructed in multiple planes, including 3D. We're the only facility in Okanogan county with this capability!

### General Radiography (X-Ray)

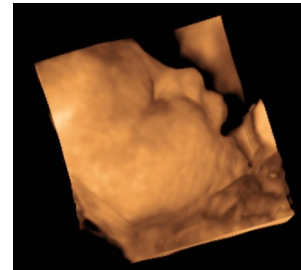

Full spectrum of x-ray services, examining virtually of any part of the body. We can provide images of the body's internal structures. These images are thoroughly reviewed by our radiologists.

### Picture Archiving Communication System (PACS)

The latest technology for storing and sending your imaging. We provide the capability of sending your radiology exam directly to your doctor as a digital image nearly anywhere instantaneously.

### Ultrasound

At North Valley Hospital we have 3D & 4D ultrasound which provide three dimensional images of a fetus. Ultrasound can also be used to examine body organs and systems like the heart, spinal cord, or cysts. We can provide your first pictures of your baby.

### Digital Fluoroscopy

This imaging technique provides real time, live imaging of your internal organs as they function. Contrast media is usually used to detect abnormalities or disease.

### MRI

We contract our MRI with a company called "Mobile MRI of Idaho". This service is available every Tuesday from 8AM to 5PM. MRI studies are used to generate images of all sorts of body tissues that you might not be able to see on x-ray or CT scan.

### DEXA Bone Density Scanning

Dexa scans are most commonly used to measure bone density, and is one of the most accurate ways to diagnose osteopenia and osteoporosis. We offer this service 5 days a week. For athletes, or for people with a variety of concerns about their fitness, our machine has the capability of determining an extremely accurate Body Mass Index (BMI), which can be tracked indefinitely.
